## PROFESSIONAL SUMMARY

---

Backend-focused Full Stack Developer specializing in PHP Laravel, JavaScript, and TypeScript with experience building web applications, RESTful APIs, and database-driven systems. Skilled in backend architecture, authentication, role-based access control, and database design using MySQL and PostgreSQL. Experienced in developing scalable and maintainable software solutions that improve business workflows and data reliability.

## TECHNICAL SKILLS

---

**Languages:** JavaScript, TypeScript, PHP, HTML5, CSS3

**Frameworks & Libraries:** Laravel, React.js, Next.js, Vue.js, Tailwind CSS

**Backend Development:** RESTful APIs, MVC Architecture, Authentication, Role-Based Access Control (RBAC), Middleware

**Databases:** PostgreSQL, MySQL

**Tools & Platforms:** Git, GitHub, Postman, VS Code, Vercel, Nginx, PM2

## EXPERIENCE

---

### Backend Developer Intern — Argo Delivery Management System | Opalus

*Feb 2026 – May 2026*

- Reduced administrative processing time by digitizing the truck booking workflow through RESTful APIs, automated validation, and structured backend business logic, replacing manual booking processes with a centralized system.
- Improved application security by implementing role-based access control (RBAC) through custom middleware and Laravel policies, preventing unauthorized access and ensuring users only performed permitted actions.
- Preserved historical financial accuracy by redesigning the database structure to store immutable pricing records instead of referencing mutable product prices, ensuring receipts remained consistent even after price updates.
- Prevented duplicate truck scheduling and booking conflicts by implementing backend validation rules and workflow checks, improving delivery management reliability.
- Improved system maintainability by developing organized Laravel backend services and database interactions, enabling smoother feature expansion and easier troubleshooting.
- Supported reliable application deployment by configuring production services using Nginx and PM2, ensuring stable backend operation.

## PROJECTS

---

### Internship Platform API — Backend Development | Personal Project

*June 2026 – Now*

- Improved internship application management by developing a backend API platform that connects students and companies through structured internship listings and application workflows.
- Strengthened application security by implementing Laravel Sanctum authentication and role-based access control (RBAC), ensuring users only accessed resources based on their assigned permissions.
- Protected sensitive applicant information by implementing private resume storage and controlled file retrieval logic, allowing resume access only through authorized application relationships.
- Automated application status notifications by implementing background jobs and queued email processing, improving communication efficiency between users during application updates.
- Improved backend maintainability by designing structured business logic and API endpoints, separating application workflows from data access operations.

### Full Stack Developer — Agro Farm Management System | Client-Based Capstone Project

*Sept 2025 – Jan 2026*

- Digitized agricultural management workflows by developing a web-based farm management system for a real client stakeholder, replacing manual processes with a centralized platform for managing farm operations.

- Improved information accessibility by designing database-driven modules that organized and streamlined the management of farm-related records and operational data.
- Translated client requirements into functional system features by gathering feedback from the agriculturist stakeholder and implementing solutions aligned with actual farming workflows.
- Enhanced system usability by developing integrated frontend and backend functionality, creating a complete application tailored to the client's operational needs.

### **TidyTask — Fullstack Development | Personal Project**

*Nov 2025 – Dec 2025*

- Improved task organization and productivity by developing a full-stack task management application that automatically prioritizes user tasks based on urgency, difficulty, and approaching deadlines.
- Reduced manual task prioritization by designing an algorithm that evaluates task urgency and due dates, automatically adjusting task order to highlight high-priority activities before deadlines.
- Enhanced application usability by implementing task management features including CRUD operations, search, and filtering, allowing users to efficiently manage and navigate their workload.
- Strengthened application security by integrating Clerk authentication, ensuring users maintained secure access to their personal task data.
- Improved data-driven decision making by designing database structures that stored task urgency and completion requirements, enabling dynamic prioritization logic instead of simple record retrieval.

## **EDUCATION**

---

### **Bachelor of Science in Information Technology | Laguna State Polytechnic University – SPCC**

*June 2026*

**Relevant Coursework:** Software Engineering, Database Management Systems, Web Development, Systems Analysis and Design

## **CERTIFICATION**

---

Technical certifications in software development, databases, cloud technologies, and related technical skills.
